Product Description

Wacker Neuson DV100 Dual View Truck Dumper

The DV100 dual view dumper puts a new spin on material handling. The unique concept allows the entire operator's console to swivel 180° so the operator is always facing the task, providing optimal visibility regardless of the working direction or payload size. The rotation can be conveniently performed from the driver's seat by simply unlocking the seat console and then turning it around.

Setting a new standard for an unobstructed view of the job site

With the swivel seat console, the operator changes the line of sight and the forward direction of travel. Time-consuming turning and maneuvering is no longer necessary.

Especially on small, cramped construction sites, such as inner-city areas, tunnels, or busy roads, the DV100 dual view is efficient and easy to maneuver:

- the driver steers the wheel dumpers with a skip in the direction of travel to the construction site
- loads or unloads with a complete view of the loading area
- and leaves after a 180° turn of the seat console the same way with a full field of view and without having to turn the vehicle.

This allows the operator to always keep an eye on the work environment. Even a fully loaded skip no longer obstructs the view, because when the driver turns the console, the skip is behind him. The dual view dumper functions like a compact dump truck, but with terrain traction and better maneuverability.

The dual view concept

The dual view concept allows a comfortable and quick change of the seat position through a 180° turn of the entire operating and seat console. This allows the operator to always have a perfect view of the direction of travel - during transportation, loading, and unloading. The rotation can be performed conveniently from the driver's seat by simply unlocking the seat console and turning it around. All main functions, adjustable seat, steering wheel, joystick handle, throttle, brake pedal, and multi-function display rotate with the seat.
